ICTP DP Linux Basic Course - Text Files

ESP Students - First Semester

Graziano Giuliani
ggiulian@ictp.it

The Abdus Salam International Centre for Theoretical Physics

ICTP Diploma Program
September 5, 2023

Course Outline [1]

Daily program

- **UNIX/Linux**
- **Programming on Linux**
- **Text file manipulation**
  1. Row based operation
  2. Column based operation
  3. `awk`
- Basic BASH and Python

Slides:

`http://tinyurl.com/2jsvfbd6`

or the LaTeX source on GitHub:

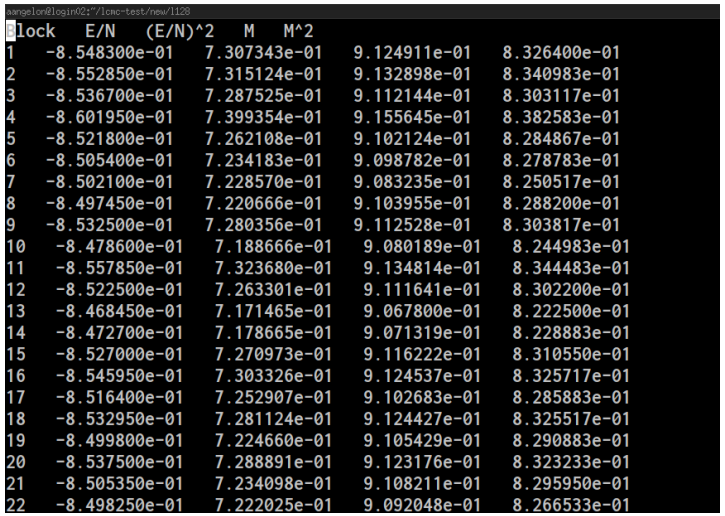
`https://github.com/graziano-giuliani/LinuxBasics`

[1] Course created in 2019 with Adriano Angelone, now LPTMC-FR

Text manipulation

Data files are commonly text files

We are scientists: we deal in **datafiles**



```
aangelon@login02:~/lcmc-test/new/1120
#lock   E/N   (E/N)^2   M   M^2

```

Shell commands allow us to manipulate them as **text files**:

great versatility and relatively simple, sometimes requires attention

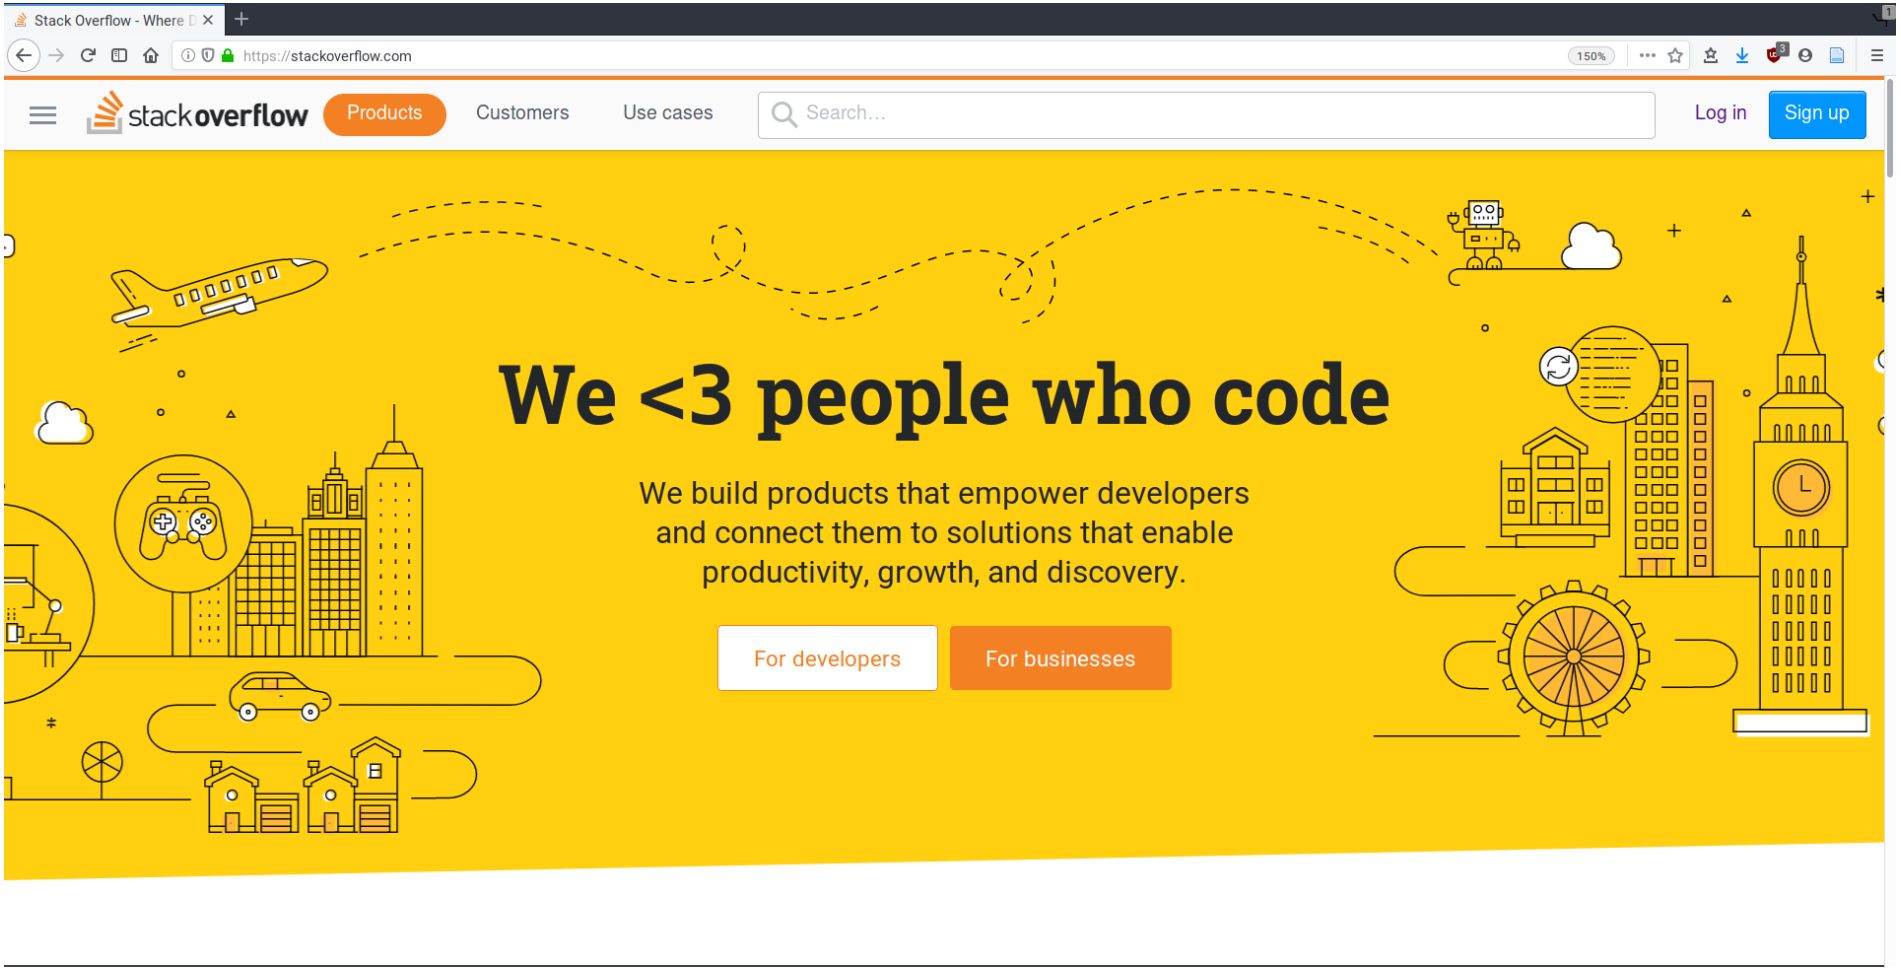
You see files as a bunch of **rows** or **columns**:

different commands for different tasks

Before we start, remember:

nobody knows everything (except the internet)

Stackoverflow and **Google** will help you, use them



Manual Pages

Online help

We have seen in lesson 1 that all basic UNIX commands come with a manual page. The manual page can be accessed through the `man` program.

- `man` is the system manual pager program. You provide as argument the name of a program, utility or function.
- The program searches for the manual page in various section in a pre-defined order.
- The manual page is shown using a pager program after being formatted for the particular terminal output.

Example

```
man cat
```

Row Operations

Display file on screen

Create example file

Open a text `example_file` and write five lines with numbers `10,20,30,40,50` one per line.

`cat <files>`: displays entire files

- `-n`: add line numbers

```
~ » cat example_file
10
20
30
40
50
~ » cat -n example_file
     1  10
     2  20
     3  30
     4  40
     5  50
```

Row Operations

Partial display

`tail <files>`: displays 10 last line of a file

- `-n <num>`: last `<num>` lines
- `-n +<num>`: after line `<num>`

```
~ » tail -n 3 example_file
30
40
50
------------------------------
~ » tail -n +2 example_file
20
30
40
50
```

`head <files>`: displays 10 top line of a file

- `-n <num>`: first `<num>` lines
- `-n -<num>`: before line `<num>`

```
~ » head -n 3 example_file
10
20
30
------------------------------
~ » head -n -3 example_file
10
20
```

Interlude

Pipes and redirection

Piping: `|`

output of command serve as input to another

```
command_1 <arguments> | command_2 | ...   | command_N
```

Example: extract 3rd line of file

```
head -n 3 <file> | tail -n 1
```

Redirection: `>`, `>>`

write the output of a command into a text file

Use `>>` to append to existing file

```
command +options +arguments > file
```

```
~/test_dir » ls
file_1  file_2  file_3

~/test_dir » ls > log

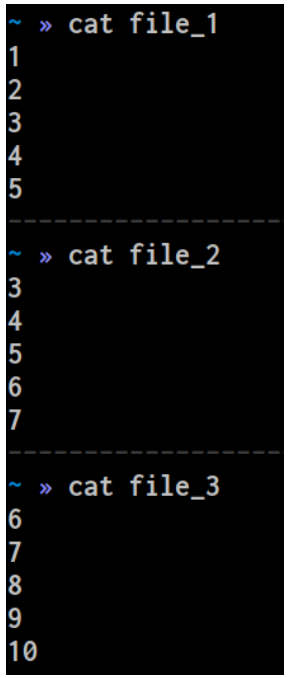
~/test_dir » ls
file_1  file_2  file_3  log

~/test_dir » cat log
file_1
file_2
file_3
log
```

Exercise I

cat, tail, head

Create the following 3 files:



Use pipes and redirection where needed.

Write a scripts that creates a file containing the first 3 rows of `file_1`, the 2nd and 3rd lines of `file_2` and the last 3 lines of `file_3` and displays this file on the screen.

filter lines based on their content

```
grep <content> <files>
```

- `<content>` can be a part of the line
- Quoting (`'<content>'`) is advised
- `-n`: adds numbers to matching lines
- `-i`: case-insensitive matching
- `-v`: prints non-matching lines

```
~ » cat example_file
10 a
20 b
30 I want this one
40 d
50 e
-----------------------------------
~ » grep 'want' example_file
30 I want this one
-----------------------------------
~ » grep -n 'want' example_file
3:30 I want this one
-----------------------------------
~ » grep -n -i 'WANT' example_file
3:30 I want this one
-----------------------------------
~ » grep -v -i 'WANT' example_file
10 a
20 b
40 d
50 e
```

More flexibility using **regular expressions**

Interlude

Regular Expressions: templates to match

Special characters and **wildcards**

- `.`: any single character
- `.*`: any number of characters
- `^`, `$` : beginning and end of the line
- `[adf]`, `[a-z]`, `[A-Za-z]`: group of characters

```
The quick brown fox jumped
```

- `.*quick.*` **matches**
- `The quick brown.*jumped.*` **matches**
- `The quick brown [foxape]* jumped .*` **matches**
- `^quick.*` **doesn't match**

Check quoting

```
grep '.*quick.*' <files>
```

Exercise

grep

Create the following file:

```
#Index Name Surname Product
1 Robert Duvall Oranges
2 Al Pacino Peaches
#2 Marlon Brando Grapes
2 Diane Keaton Tamarindos
20 Robert DeNiro Cherries
```

Create a script which filters out commented lines (starting with `#`), selects all lines where the index is 2, then selects only who sells tamarindos. Use redirection and/or piping.

Hint

The line begins with the index. Watch case.

Row Operations

sed

Stream EDitor

`sed` operates on files as groups of lines:
finds lines matching regexps and acts on (or around) them

- `sed '/<regexp>/a <text>' <files>`
  adds `<text>` after matching lines
- `sed '/<regexp>/i <text>' <files>`
  adds `<text>` before matching lines
- `sed '/<regexp>/c <text>' <files>`
  replaces matching lines with `<text>`
- `sed '/<regexp>/d' <files>`
  deletes all matching lines

```
~ » cat example_file
10
20
30
~ »  sed '/2.*/a new' example_file
10
20
new
30
~ » sed '/2.*/i new' example_file
10
new
20
30
~ » sed '/2.*/c new' example_file
10
new
30
~ » sed '/2.*/d' example_file
10
30
```

Row Operations

More sed

- `sed 's/<regexp>/<text>/g' <files>` replaces **all** occurrence of `<regexp>` with `<text>` in all lines

```
~ » cat example_file
is this a test ?
I like apples
the pen is on the table
~ »  sed 's/apples/apples and oranges/g' example_file
is this a test ?
I like apples and oranges
the pen is on the table
~ » sed 's/apple/apples and oranges/g' example_file
is this a test ?
I like apples and oranges
the pen is on the table
~ » sed 's/is/IS/g' example_file
IS thIS a test ?
I like apples
the pen IS on the table
~ » sed 's/^is/IS/g' example_file
IS this a test ?
I like apples
the pen is on the table
```

- Replacement and matching will break words
- Matching is case-sensitive
- All regexp tools available

Remember and be careful

- `sed` can be used in pipes
- `sed -i` applies modifications **to the files**

Exercise

sed

Create the following file:

```
# Score Index Name
0,100 #1 Lucas
0,200 #2 Andrew
#0,400 #3 Mary
0,500 XXX XXX
0,300 #5 Rose
```

Create a script which:

- Replaces corrupted lines (lines containing `XXX`) with `#CORRUPTED`
- Removes commented lines (beginning with `#`) from the file
- Shows on screen the last two lines of the file replacing `,` with `.`

Required

Do not modify the original file!

Column Operations

Using cut and paste on datafiles

extract selected fields

`cut <options> <file>`

- `-d`: specify field delimiter (often `' '` or `','`)
- `-f`: specify the desired fields (separate with `,`)
- `--complement`: print unselected fields

```
~ » cat example_file
1 2 3
10 20 30
100 200 300
-----------------------------------------
~ » cut -d ' ' -f 1,2 example_file
1 2
10 20
100 200
-----------------------------------------
~ » cut -d ' ' -f 1,2 --complement example_file
3
30
300
```

join lines in multiple files

`paste <files>`

- `-d`: specify delimiter between files default: `TAB` (not space!)

```
~ »  cat example_file_1
1.0e-1 3.0e-1
2.0e-1 4.0e-1
-----------------------------------------
~ » cat example_file_2
5.0e-1 7.0e-1
6.0e-1 8.0e-1
-----------------------------------------
~ » paste -d' ' example_file_1 example_file_2
1.0e-1 3.0e-1 5.0e-1 7.0e-1
2.0e-1 4.0e-1 6.0e-1 8.0e-1
```

Column Operations

`sort` file content

sort according to the given criteria

```
sort <options> <file>
```

- `-f`: ignore case
- `-k`: specify an index column
  (order following this column, default: 1)
- `-n`: numbers sorted according to value
- `-g`: like `-n`, more general formats
  (e.g., scientific notation)
- `-h`: like `-n`, human-readable formats
  (e.g., `4K, 8M`)
- `-r`: reverses sort order (descending)
- `-u`: eliminates repeated lines

```
~ » cat example_file
a   1
C   02
C   02
b   0.5e+00
~ » sort example_file
C   02
C   02
a   1
b   0.5e+00
~ » sort -f example_file
a   1
b   0.5e+00
C   02
C   02
~ » sort -k2 example_file
b   0.5e+00
C   02
C   02
a   1
~ » sort -k2 -g example_file
b   0.5e+00
a   1
C   02
C   02
~ » sort -k2 -g -r example_file
C   02
C   02
a   1
b   0.5e+00
```

Exercise

cut, paste, sort

Create the following 2 files:

`example_file_1.dat`

```
1.0e-1 3.0e-1
2.0e-1 4.0e-1
```

`example_file_2.dat`

```
8.0e-1 5.0e-1
7.0e-1 6.0e-1
```

Write a script which:

- Pastes the two files together
- Sorts the output according to the 3rd column
- Prints out the 2nd column of the line with the highest value of the 3rd column

Hint

Remember the options of `sort` (`-g` in particular).

Remember `head/tail`.

awk

Pattern scanning and processing language

awk is a programming language for text operations mostly used to work on files as sets of columns

`awk` program structure

```
BEGIN { 1 } { 2 } END { 3 }
```

1. **Initial instructions** : before reading the file.
2. **Line instructions** : on each line of the file.
3. **Final instructions** : after the file has been read.

Only block `{ 2 }` is required

```
awk '{ <commands> }' <file>
```

Basic branching syntax can be used

```
if...then...else
```

print

Writes to standard output: use `""` for strings
Special variables:

- `NR` is the current line
- `NF` is the number of fields of the current line

```
~ » cat example_file
a e 1.0
b f 2.0
c g 3.0
d h 4.0
```

```
~ » awk '{print NR}' example_file
1
2
3
4
```

```
~ » awk '{print NF}' example_file
3
3
3
3
```

Access fields via `$<field_number>`

- `$0` is the entire line
- `$NF` is the last field

```
~ » awk '{print $3}' example_file
1.0
2.0
3.0
4.0
```

```
~ » awk '{print $3"-1", $3 - 1.0}' example_file
1.0-1 0
2.0-1 1
3.0-1 2
4.0-1 3
```

Fields can be manipulated as strings or floating-point numbers

Exercise

awk

Create the following file:

```
# a b
0.1 1.1
0.2 1.2
0.3 1.3
0.4 1.4
```

Write a script which writes to a new file the row number, the difference and the squared difference of columns 1 and 2 (in this order) of the starting file (neglecting the label row).

Hint

In awk you can perform operations between columns, with the usual operators (`+, -, *, /, ()`).
